<DC-01> Authoritative SysML v2 Model
doc
The framework shall maintain its authoritative system model as conformant textual SysML v2 source. Verification is by inspection of the designated authoritative source and successful parsing and semantic validation by a conformant SysML v2 implementation.
Source: project technical baseline recorded in Manage System Development.
subject
framework : 'Nanosatellite EPS Engineering Framework'
require constraints
docThe authoritative system model is conformant textual SysML v2 source.
statement { }
«#projectImposedDesignConstraint requirement»
<DC-02> Version-Controlled Textual Baseline
doc
The framework shall maintain the authoritative SysML v2 model and report source as text files in one version-controlled project repository, and each evaluation baseline shall be identified by an immutable repository revision. Verification is by repository inspection and demonstration that a recorded revision reconstructs the designated model and report.
Source: project technical baseline. Supporting rationale: buruso2026modelbased Secs. 4.4 and 5.1; rostamnia2026digitaltwin Secs. 8.4-8.6 and Table 13.
subject
framework : 'Nanosatellite EPS Engineering Framework'
require constraints
docThe authoritative model and report are controlled as text in one repository, and every evaluation baseline resolves to an immutable repository revision.

<DC-00> Project-Imposed Framework Design Constraints
doc
The implemented framework conforms to the technology and configuration-control choices imposed by the project technical baseline. DC-01 and DC-02 are design constraints rather than stakeholder-derived performance requirements.
subject
framework : 'Nanosatellite EPS Engineering Framework'
require constraints
docThe implementation satisfies every retained project-imposed design constraint.
