(a) Battery sizing calculation

```
energy = (eclipse_energy / depth_of_discharge
          * (1 + degradation_margin))
_finite(energy)
return Energy(energy)
```

(b) Algebraic expression

$$E_{\text{Battery}} = \frac{E_e}{\text{DoD}}(1 + M)$$

`eclipse_energy`	E_e (J)
`depth_of_discharge`	DoD
`degradation_margin`	M

$$\frac{6000\ \text{J}}{0.5}(1 + 0.2) = 14400\ \text{J}$$
